

5 COMMON SIGNS YOUR ELGI AIR COMPRESSOR NEEDS

IMMEDIATE AFTERSALES SERVICE

High Discharge Temperatures

Clogged coolers or filters cause frequent thermal shutdowns and risk permanent air end damage.

Line Pressure Drops

Blocked intake filters or failing valves choke air supply and force the motor to draw higher power.

Excessive Oil Carryover

Ruptured separator elements leak oil residue into downstream lines, contaminating end products.

Unexplained Energy Spikes

Mechanical friction or stuck valves increase electricity costs without any increase in production output.

Abnormal Noise & Vibration

Knocking or screeching indicates internal bearing wear that can quickly lead to a seized air end.
